

Domain

What do I have to consider when using own nameservers for domains?

To ensure proper connectivity of your domain at the registry the following technical quality guidelines must be adhered to in order to use own nameservers.

General

All provided Nameservers must be reachable und authoritative for the zone.

Redundant connectivity

At least two nameservers are required, where at least one of these must be connected via IPv4. At least one Nameserver must be connected with an IP address which is different from the IP addresses of all other nameservers.

Requirements for zone data

The NS RRSets must exactly match the list of given nameservers. A CNAME record for the zone is forbidden. The referral response must have a maximum size of 512 Bytes to fit in a UDP packet.

Other requirements for the nameservers

IPv6 addresses must be in the global unicast address range.
