PHP und mySQL
Why is my homepage not displayed via Wordpress?

The blog and CMS-Software "Wordpress" has, due to its abundance of features, a higher memory consumption. If you want to successfully install a Wordpress standard installation a minimum of 64MB of the PHP-variable "memory_limit" is required.

Please be aware of this when ordering a shared hosting plan. If there is less memory the system will not work correctly due to memory errors. Normal usage is not possible in this case.
