## Allgemein How can I use Python scripts?

Provided use of python scripts is included in your shared host package you can use them as follows:

| (To test it you can use the following python script, named "mptest.py")   |
|---|
| ======================================  |
| def handler(req):     req.content_type = "text/plain"     req.send_http_header()     req.write("Hello World!")     return apache.OK |
|   |
| You will possibly have to enter the following into the .htaccess:   |
| ======================================  |
| If needed:  |
| ======================================  |
|   |
| The handler for the .py file ending has already been set.   |
| Now call up the appropriate URL specify mptest.py as filename, the text "Hello World!" should appear.                               |
|   |
