

Linux

Why are some system files overwritten during a reboot?

Virtualization solution: OpenVZ / Virtuozzo

Situation:

When a vServer is restarted, partial system files are overwritten. These include e.g. the hostname or the resolver configuration `/etc/resolv.conf`.

Reason:

The virtualization solution writes some files on the hostnode. This is specified on the system side and can not be switched off.

Workaround:

As a workaround, you can use `rc.local` to copy your own file at system startup and automatically replace the newly written one. Alternatively, such a copying operation can be aborted regularly with an entry in the crontab.

Unique solution ID: #1771
