

Live Monitoring System

How do I integrate the Live Monitoring System on my root server ?

In this article we are explaining how to use the EUserv Live Monitoring System (LMS) on your server.

The following steps are required to use LMS on your server:

- Download the LMS from our servers via wget:
wget --no-check-certificate
https://cdn.euserv.com/ressources/lms/live_monitoring_system
- Copy the LMS to its point of destination and make it executable:
mv live_monitoring_system /usr/local/bin/live_monitoring_system && chmod 700 /usr/local/bin/live_monitoring_system
- Add the following line to the file /etc/crontab
echo "*/5 * * * * root /usr/local/bin/live_monitoring_system" >> /etc/crontab
- Make sure you have installed "curl" and the cron service is running and loaded at the system start.
Debian
update-rc.d cron enable 2
Redhat/CentOS
chkconfig crond on

Done. Now you can see the status of your server in the customer center (after selecting your server contract).
